**Supplemental Figure S4. CpG-STAT3ASO conjugates are internalized into early endosomes after 30 min of treatment, released into cytoplasm after 1 h and co-localized with RNaseH in 4 h. Co-localization of the CpG-STAT3ASO<sup>Cy3</sup> with early endosomes was assessed using confocal microscopy after 15 min, 30 min. and 1 h of incubation of DU145 cells with 250 nM of CpG-STAT3ASO<sup>Cy3</sup>. Cells were stained for early endosome antigen 1 (EEA1) and nuclei using DAPI. (B, C) Co-localization of the CpG-STAT3ASO<sup>Cy3</sup> with RNaseH was assessed using confocal microscopy and proximity ligation assay after 4 h of incubation of DU145 cells with 250 nM of CpG-STAT3ASO<sup>Cy3</sup>.**
